Introduction to Deep Well Injection as a Disposal Option

Anna Feldman SCS Engineers October 10, 2024 AEF Convention

Injection Wells: What We'll Cover

• When is an injection well a good option to consider?

• How are environmentally safe injection wells built?

3

State-Specific Considerations

• What would an injection well project look like in Arkansas?

1

Background and Use Cases

- How are injection wells classified?
- What circumstances would make an injection well a good disposal option?

Definition

- Underground Injection: the technology of placing fluids underground through wells
 - Underground rock formations contain voids and pore space of varying size and connectivity
 - Varying capacity for fluid storage and flow
- Encompasses multiple types of projects...

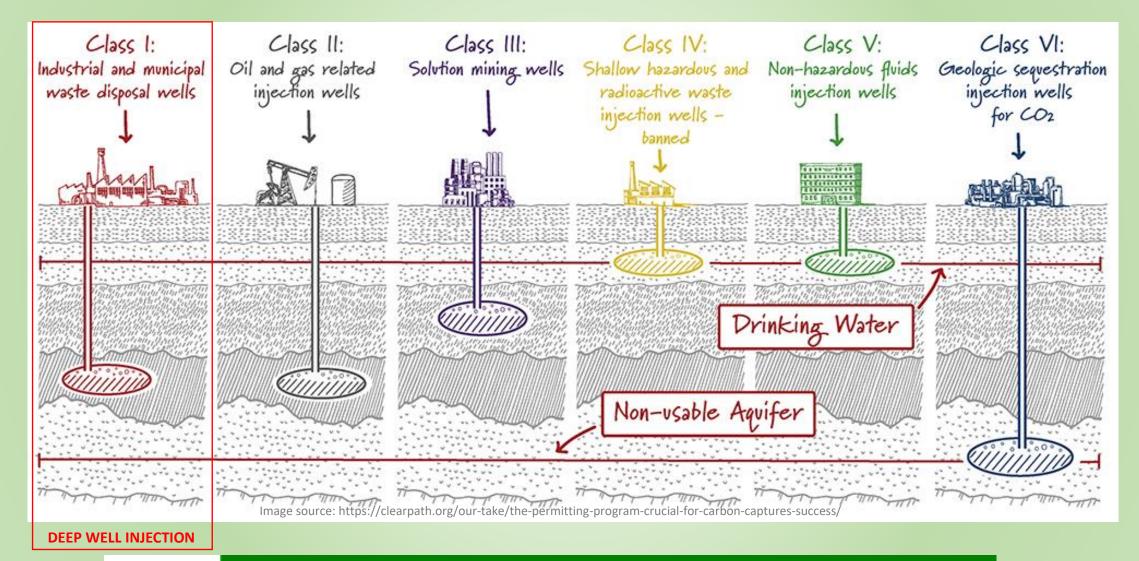

History

- 1930s: First injection wells oil companies converting production wells
- 1940s: Steel industry disposal wells
- 1950s: Manufacturing disposal wells
- 1960s: Municipal wastewater disposal wells
- **1970s: EPA granted the authority to regulate underground injection** (part of the Safe Drinking Water Act)
- 1980s: EPA develops UIC (Underground Injection Control) program

2000s: Hydraulic fracturing excluded from UIC regulations in 2005; Carbon sequestration applications emerge

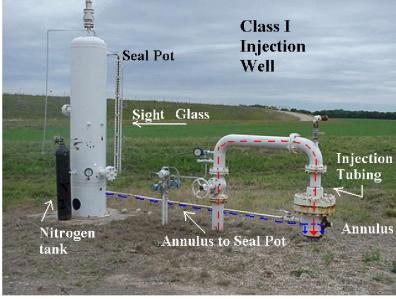

EPA Classifications

Wells that inject hazardous and non-hazardous waste beneath the lowermost formation containing an underground source of drinking water (USDW) within ¹/₄ mile of the well bore.

Injection Wells – EPA Classifications

Class I – Deep Well Injection

- Hazardous and nonhazardous wastewater
- 800+ permits nationwide
- Industry w/wastewater landfill leachate, municipal water treatment, power plants...
- Timeline for hypothetical Illinois well, feasibility to operation: ~20-38 mos
- Cost for hypothetical Illinois well: \$8-14.75M

Class VI – Carbon Sequestration

- Carbon dioxide
- 7 permits nationwide (~40 applications)
- Industry w/ captured emissions refineries, power plants...
- From feasibility to operation ~12-48 mos
- Cost ~ \$10-40M

Example: \$7 Million Zero-Discharge Facility

- Illinois site
- Completed 2019
- ROI: 9 months
- Rate: 10 million gallons/year
- Asset life design: 30 years
- Unit costs: <\$0.05/gallon

YR 1	 Studies: feasibility, siting, water balance \$30K
YR1	Permitting\$160K
YR2	Drill and complete well\$3M
YR2	 Complete pretreatment and pumping \$4M

Use Cases – Class I

Security/Permanence

- Protects surface and drinking water
- Constant amid changing regs and POTWs

Compliance

- Zero discharge
- Strict surface water discharge regs

If More Cost Effective than Alternatives

- Treatment
- Shipping/Hauling

E.G. Leachate, contaminated groundwater, industrial wastewater, municipal wastewater

Use Cases – Class VI

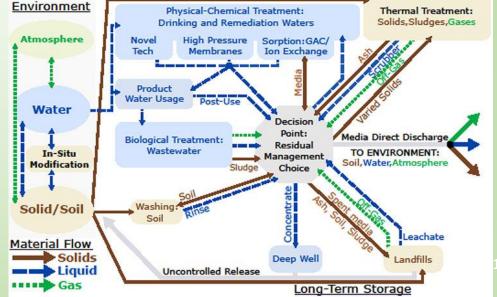

- Carbon Sequestration Incentives
- Grant opportunities
- High-CO2 Effluent Streams
- Carbon Capture and Storage

...For this presentation, focusing on Class I wells

Evolving Regulations - PFAS

- Per- and Polyfluoroalkyl Substances
- Difficult to break down/treat; residuals still challenging
- EPA working to create guidelines:
 - "...proactively prevent PFAS from entering air, land, and water at levels that can adversely impact human health and the environment"
- EPA identifies Class I injection wells as a favorable PFAS management option (March 2024 Interim Guidance on the Destruction and Disposal of PFAS)

2

Research, Design, Monitoring

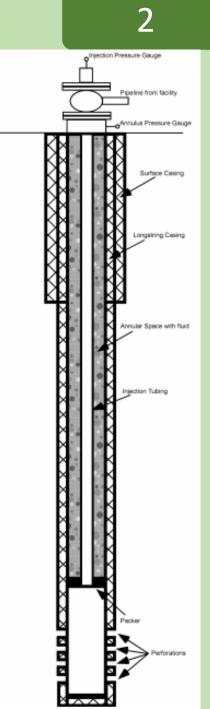

- What conditions make a site suitable for an injection well?
- How is an injection well constructed?
- Which factors are tested/monitored during a well's lifetime to confirm it is operating as intended?

- Siting Requirements (Geology)
- Multilayered Environmental Safeguards (Redundancy)
- Site selection for >20 year asset life

Factors that modern disposal methods consider to stay effective and environmentally safe

Siting an Injection Well

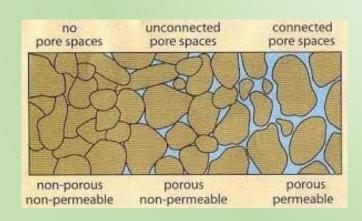

Suitable Geology: Thickness, Porosity and Permeability

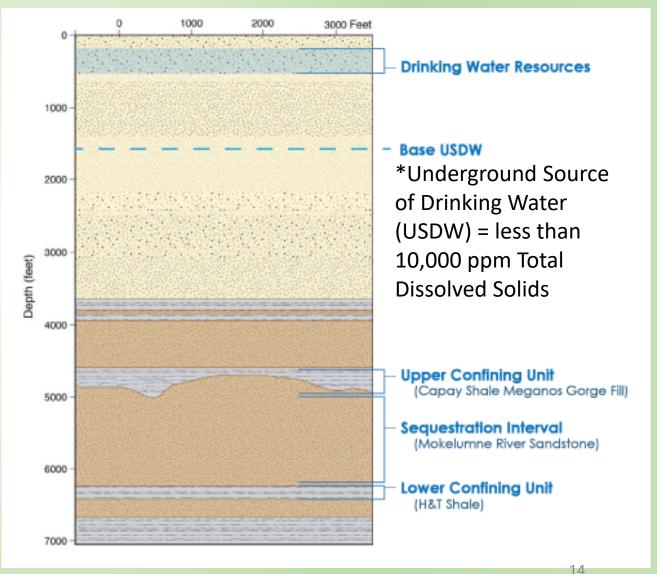

Injection Interval

- Formations with capacity to accept wastewater volumes
- Thick formations with high permeability

Confining Units

- Formations to prevent upward migration of fluid into protected aquifers
- Thick formations with low permeability

Siting an Injection Well

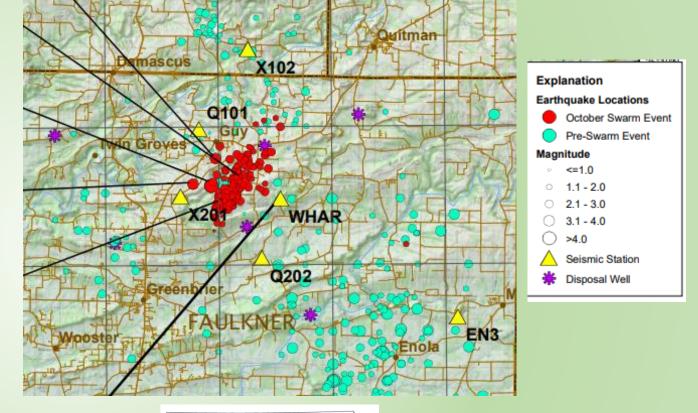

Suitable Geology: Pressures

Fluid interactions: Existing and Injected

 Injection pressure should be maintained below a calculated maximum to prevent fracturing or fracture propagation

Faults and Seismicity

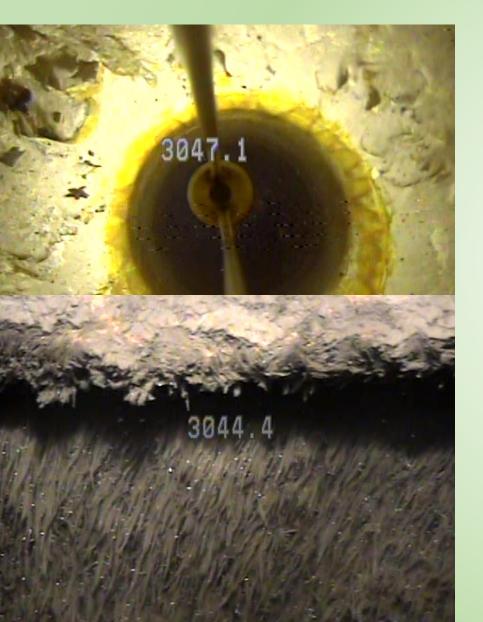

- Evaluate location regarding known faults and potential for injection rate and pressure to induce seismic activity
- **Current moratorium on Class II injection wells resulted from induced seismicity - Earthquake Swarm in 2010

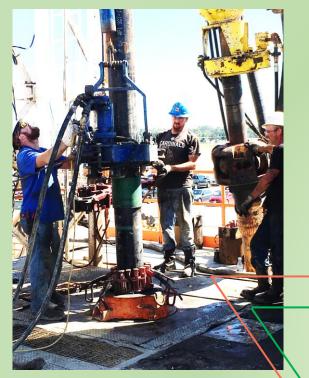

15

Know Your Waste Stream

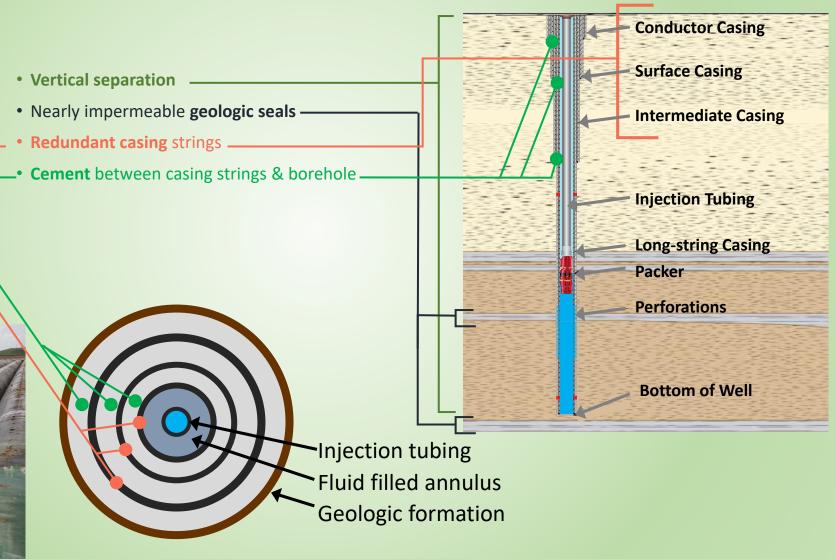

- How will waste stream chemistry interact with formation fluid chemistry?
- Accounting for chemical makeup → maintaining well integrity and keeping costs in line

Well Construction - Subsurface

Well Construction – Surface Design Factors

- Pump sizing (if gravity injection impossible)
 - 200-2000 gpm rate; 0-2000 psi pressure (dependent on reservoir characteristics)
- Pre-treatment
 - Filtration
 - Disinfection
 - Mass removal

Testing and Monitoring

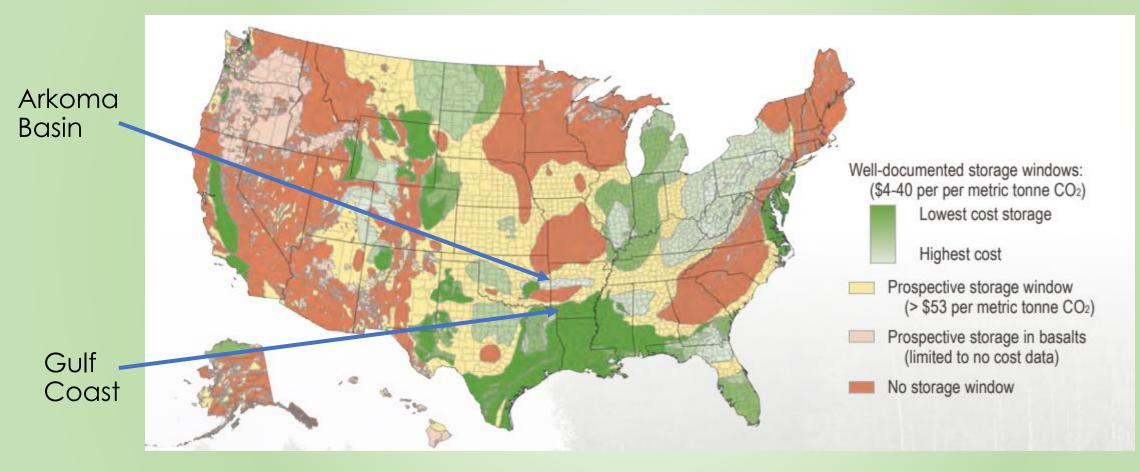

- Periodic Testing:
 - Annulus pressure test
 - Measure pressure buildup in injection zones
 - Radioactive tracer test
 - Log testing for movement of fluid along borehole
 - Casing inspection logs
 - Annual Mechanical Integrity Tests
- Continuous monitoring: well pressures and flows
 - Injection tubing pressure
 - Annulus pressure
 - Flow rate
 - Injection volume
 - pH of injected fluids

- What formations in Arkansas have the potential for suitable injection interval geology?
- What steps take an injection well project from initiation to completion?

Potential Storage Areas – Not a Guarantee of Suitability!

Roads 2 Removal – Carbon dioxide sequestration (even more stringent regs) Only guarantee of suitability is an Approved Permit Application!

Arkansas UIC Program

- ADEQ has primacy over Class I injection wells; conducts bimonthly inspections
- 7 active Class I injection well permits as of October 2024 – ADEQ database
- Active injection intervals range from 2500 to 8700 feet below ground surface
- Review timelines and costs vary from project to project

Components of a Project: Initiation to End-of-Life

Study & Permit	Pre-Treatment	Planning and	Construction	Operation and
Application	Design	Procurement		Maintenance
 Feasibility Study Begin conversation with regulators Specific cost estimate Site Characterization Area of Review Well Design Operations and Monitoring, Plugging and Abandonment Plans Financial Assurance ADEQ Submittal 	 Begin during Regulatory Review Pre-treatment design Refine pre- treatment cost estimates **IF NECESSARY** 	 Begin during Public Notice Period Refine construction cost estimates Construction planning Subcontractor selection Procurement 	 Site Preparation Injection Well Construction Testing Commissioning Application to Operate Public Notice & Hearing Receive Permit to Operate 	 System Start-up & Commissioning Compliance Testing, Monitoring and Reporting Financial Assurance Plugging and Abandonment

Public Notice and Reaction

- Two public notice periods required for Class I wells
 - When permit application submitted
 - When the Department informally decides whether to approve or deny the permit
- **Communication** with the public necessary to demonstrate environmental safety, defuse existing negative associations

3

In Conclusion...

- Injection wells: Disposal option for fluid waste streams that protects surface water and underground drinking water
- Technical Design Elements Key to Safety: **Geology**, **Chemistry**, **Testing and Monitoring**
- ADEQ UIC program regulates Class I injection wells and **state specific permitting process**

Thank you! Any questions?
